Art Unit: 1638

DETAILED ACTION

1. Claims 1-3 are pending and are examined in the present office action. Nucleotides 1 through 816 of SEQ ID NO:2 are included in the examination.

Specification

2. The specification is objected to because SEQ ID NO:2 of the sequence listing is disclosed as being a DNA molecule from Arabidopsis, but the specification discloses that SEQ ID NO:2 is isolated from cotton (page 4, lines 12-13).

Written Description

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3. Claims 1 and 3 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

The claims are drawn to a promoter that is cotton fiber-specific comprising the promoter of the cotton actin gene CFACT1 or a promoter that is cotton fiber-specific comprising an active fragment of nucleotides 1 through 816 of SEQ ID NO:2.

Art Unit: 1638

Applicants isolated a cDNA clone from a cDNA library made from young cotton fibers which was subsequently sequenced and identified as a CFACT1 cDNA fragment (pages 9 and 10). This fragment was used to isolate the genomic sequence which is listed as SEQ ID NO:2 (pages 13-14). Applicants disclose that the first 0.8 kb of SEQ ID NO:2 comprise the promoter.

The Applicants do not identify essential regions of the CFACT1 promoter sequence comprising bases 1 to 816 of SEQ ID NO:2, nor do Applicants describe any fragments of said sequences that has the activity of bases 1 to 816 of SEQ ID NO:2. The Federal Circuit has recently clarified the application of the written description requirement to inventions in the field of biotechnology. See University of California v. Eli Lilly and Co., 119 F.3d 1559, 1568, 43 USPQ2d 1398, 1406 (Fed. Cir. 1997). In summary, the court stated that a written description of an invention requires a precise definition, one that defines the structural features of the chemical genus that distinguishes it from other chemical structures. A definition by function does not suffice to define the genus because it is only an indication of what the gene does, rather than what it is. The court goes on to say, "A description of a genus of cDNAs may be achieved by means of a recitation of a representative number of cDNAs, defined by nucleotide sequence, falling within the scope of the genus or of a recitation of structural features common to members of the genus, which features constitute a substantial portion of the genus." See University of California v. Eli Lilly and Co., 119 F.3d 1559; 43 USPQ2d 1398, 1406 (Fed. Cir. 1997).

Applicants fail to describe a representative number of CFACT1 promoter sequences that direct expression in the same spatial and temporal pattern as nucleotides 1 to 816 of SEQ ID NO:2 or Applicants fail to describe promoter fragments of bases 1 to 816 of SEQ ID NO:2 that direct expression in the same spatial and temporal pattern as bases 1 to 816 of SEQ ID NO:2.

Art Unit: 1638

Applicants only describe a single promoter sequence comprising bases 1 to 816 of SEQ ID NO:2. Furthermore, Applicants fail to describe structural features common to members of the claimed genus of polynucleotides. Hence, Applicants fail to meet either prong of the two-prong test set forth by *Eli Lilly*. Furthermore, given the lack of description of the necessary elements essential for the promoter sequence of bases 1 to 816 of SEQ ID NO:2, it remains unclear what features identify a cotton fiber-specific promoter of bases 1 to 816 of SEQ ID NO:2. Since the genus of CFACT1 promoter sequences comprising bases 1 to 816 of SEQ ID NO:2 has not been described by specific structural features, the specification fails to provide an adequate written description to support the breath of the claims.

Scope of Enablement

4. Claims 1 and 3 are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for a cotton fiber-specific promoter comprising bases 1 to 816 of SEQ ID NO:2, does not reasonably provide enablement for any cotton fiber-specific promoter comprising any promoter of any cotton fiber-specific actin gene CFACT1 or any promoter comprising any fragment of bases 1 to 816 of SEQ ID NO:2. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention commensurate in scope with these claims.

The claimed invention is not supported by an enabling disclosure taking into account the Wands factors. In re Wands, 858/F.2d 731, 8 USPQ2d 1400 (Fed. Cir. 1988). In re Wands lists a number of factors for determining whether or not undue experimentation would be required by one skilled in the art to make and/or use the invention. These factors are: the quantity of

Art Unit: 1638

experimentation necessary, the amount of direction or guidance presented, the presence or absence of working examples of the invention, the nature of the invention, the state of the prior art, the relative skill of those in the art, the predictability or unpredictability of the art, and the breadth of the claim.

The claims are drawn to a promoter that is cotton fiber-specific comprising the promoter of the cotton actin gene CFACT1 or a promoter that is cotton fiber-specific comprising an active fragment of nucleotides 1 through 816 of SEQ ID NO:2.

Applicants isolated a cDNA clone from a cDNA library made from young cotton fibers which was subsequently sequenced and identified as a CFACT1 cDNA fragment (pages 9 and 10). This fragment was used to isolate the genomic sequence which is listed as SEQ ID NO:2 (pages 13-14). Applicants disclose that the first 0.8 kb of SEQ ID NO:2 comprise the promoter, which was subsequently operably linked to the GUS reporter gene and transformed into cotton and tobacco (pages 14-19, Example 3). Transgenic cotton exhibited GUS activity only in young fibers and transgenic tobacco exhibited GUS activity in seeds (paragraph bridging pages 18 and 19).

The state-of-the-art teaches using pieces of a promoter that do not contain the full compliment of cis-acting elements, will not produce the expression profile as observed using the whole promoter fragment. Kagaya et al (1995, Mol. Gen. Genet. 248:668-674) teach the rice chloroplastic aldolase promoter contains two elements, one of which acts as a negative element while the other acts as a positive element that confers developmentally regulated mesophyll cell specific expression. Removal of either of these regions changes the normal expression pattern

Control Number. 10/007,5

Art Unit: 1638

(page 670, left column). Kagaya et al also teach that the promoter contains an element that serves as a target for light induction (abstract).

Benfey et al (1990, Science 250:959-966) teach that the 35S CaMV promoter consists of domains that individually regulate spatial expression within plants. "The combination of each of the five B subdomains with domain A results in an expression pattern that differs from that of the individual subdomains or domain A" (page 961, left column, 2nd paragraph). In other words, deleting a required domain will jeopardize the proper spatial and temporal expression pattern. In addition, Benfey et al (1989, EMBO J, 8(8):2195-2202; page 2200, left column 2nd paragraph) teach that not only are the promoter domains important for specifying proper spatial and temporal expression but that when all domains were present, the quantity of expression increased.

Applicants have not disclosed how one makes or isolates any of the sequences that are encompassed by Applicants' broad claims. Applicants have not taught which regions of the respective polynucleotides can be used to amplify any of said polynucleotides or which regions can be used as a probe to isolate any of said polynucleotide sequences.

In the absence of guidance, undue trial and error experimentation would be required for one of ordinary skill in the art to screen through the multitude of non-exemplified sequences, either by using non-disclosed fragments of bases 1 to 816 of SEQ ID NO:2 as probes or by designing primers to undisclosed regions of bases 1 to 816 of SEQ ID NO:2 and isolating or amplifying fragments, subcloning the fragments, producing expression vectors and transforming plants therewith, in order to identify those, if any, that when over-expressed direct expression in cotton fibers.

Art Unit: 1638

Therefore, given the breadth of the claims; the lack of guidance and examples; the unpredictability in the art; and the state-of-the-art as discussed above, undue experimentation would be required to practice the claimed invention, and therefore the invention is not enabled.

Claim Rejections - 35 USC § 102

- (a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.
- 5. Claim 3 is rejected under 35 U.S.C. 102(a) as being anticipated by Miki et al (October 1999, WO 99/53067-A2).

The claim is drawn to a promoter that is cotton fiber-specific comprising an active fragment of the promoter sequence of nucleotides 1 through 816 of SEQ ID NO:2.

Miki et al disclose SEQ ID NO:9 which comprises a promoter set forth in bases 1-5514 of SEQ ID NO:9, and said region exhibits 49% identity with Applicants' nucleotides 1-816 of SEQ ID NO:2. The sequence of Miki et al directs expression in the seed coat of soybean and also in trichomes. It would be inherent that the promoter sequence of Miki et al would express in cotton fibers given that both cotton fibers and trichomes comprise cells of the epidermis of seeds and given that Applicants' sequence also directs expression in the seed coat of non-cotton plants, e.g., of tobacco (paragraph bridging pages 18 and 19). Given Applicants' definition of fragment, "A fragment can comprise excisions, deletions, truncations or substitutions of the sequence of nucleotides 1-816 of SEQ ID NO: 2, or a combination of these" (page 7, lines 19-22), and as such, Miki et al anticipate the claimed invention.

Art Unit: 1638

- 6. Claim 2 is deemed free of the prior art, given the failure of the prior art to teach or reasonably suggest an isolated polynucleotide of bases 1 to 816 of SEQ ID NO:2.
- 7. Claim 2 is allowed.
- 8. Claims 1 and 3 are not allowed.
- 9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Stuart F. Baum whose telephone number is 571-272-0792. The examiner can normally be reached on M-F 8:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Amy Nelson can be reached on 571-272-0804. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 571-272-1600.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence encodes a SC4 protein. The promoter of this gene is differentially expressed in seed coat tissues, specifically within the outer integument, the inner integument, the thick walled parenchyma, the palisade, the stellate parenchyma, or the membranous endocarp associated with the seed coat. The seed-coat promoters may be used to express proteins of interest in seed coat tissues. Genes of interest include but are not restricted to herbicide resistance genes, genes encoding viral coat proteins, or genes encoding proteins conferring biological control of pests or pathogens, e.g. a Bt toxin. Other genes that may be expressed include proteins that alter the taste of the seed and/or affect the nutritive value of the seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel
